

Installation Guide

Prerequisites

Before you begin, ensure you have the following:

- * Python 3.10 or newer installed.
- * At least 16 gigabytes of free disk space.
- * A working internet connection for model downloads.
- * macOS 14 or Ubuntu 22.04 as the operating system.

Steps

1. Clone the repository to your local machine.
2. Create a virtual environment in the project directory.
3. Install the required Python packages from requirements.txt.
4. Download the model weights using the provided script.
5. Run the smoke test to verify the installation.

Troubleshooting

If the model fails to load, check that your machine has enough free memory. If you see a CUDA error, verify that you are not running the Apple Silicon build on an Intel machine.
